

Adobe® LiveCycle™

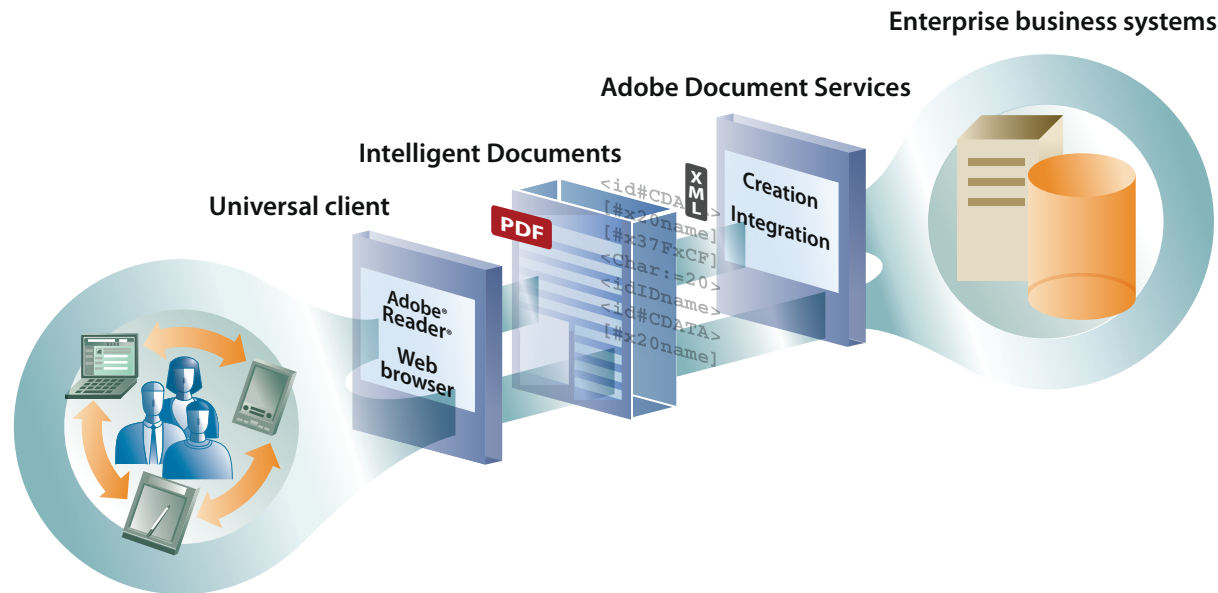

Connecting people, information, and processes

Every day, more people need to interact with and share information stored in enterprise and desktop applications. Yet most enterprise systems were not designed to address this need. Adapting existing systems to meet demand can be time-consuming, expensive, and risky. Fortunately, Adobe LiveCycle provides a fast and cost-effective way to more securely share information with people inside and outside the firewall. Adobe LiveCycle software is a new generation of server products and design tools built on the common Java™ Platform, Enterprise Edition (Java EE) architecture. By combining the

business logic and data exchange capabilities of XML with the visual fidelity, security, and reliability of Adobe PDF, Adobe LiveCycle makes it easy for companies and government agencies to convert static documents to electronic files, and then integrate them with existing enterprise applications and business processes. Ultimately, this helps organizations streamline information exchange among employees, suppliers, customers, and constituents; increase operational efficiencies; reduce costs; and meet compliance mandates.

“With Adobe solutions, we’re reaching more customers faster with better services, while substantially lowering our costs of doing business.”

Greg Davenport
Assistant Vice President,
Director of Surety Operations
Safeco

Universal client

A universal client is a freely available interface or access point between people and Intelligent Documents. Adobe Reader® software and web browsers are examples of universal clients. As a universal client, Adobe Reader enables users inside and outside the firewall to interact with Intelligent Documents over any device, including desktops, laptops, PDAs, mobile phones, and kiosks.

Intelligent Documents

Improve both employee and customer adoption of automated business processes. Bringing together the standards of Adobe PDF and XML technologies, Intelligent Documents retain the best characteristics of paper-based documents, such as a familiar look and feel. But they also include powerful business logic, such as calculations, routing instructions, error checking, and data validation.

Adobe Document Services

Streamline the flow of business-critical information among employees, suppliers, customers, and constituents. Adobe Document Services automate existing document-based processes to help organizations and government agencies manage business processes more efficiently and facilitate more secure communications across the enterprise. Adobe Document Services include:

- Process management
- Document control and security
- Document generation
- Collaboration

Adobe LiveCycle Software

Use Adobe LiveCycle software to automate and streamline business processes that span systems, business rules, and departments. To learn more about Adobe LiveCycle and the complete line of enterprise server software from Adobe, call 1-866-766-2256 (in the U.S. and Canada) or visit www.adobe.com/enterprise.

PROCESS MANAGEMENT

Adobe LiveCycle Workflow

Adobe LiveCycle Workflow provides a complete process management solution for streamlining business processes and integrating information from core systems, business rules, web services, and all Adobe Document Services. Adobe LiveCycle Workflow enables organizations to automate both simple and highly complex business processes and provides extensive business activity monitoring (BAM) capabilities for ongoing process optimization.

Adobe LiveCycle Forms

Using Adobe LiveCycle Forms, organizations can deploy secure web and Adobe PDF forms to extend their intelligent data capture processes beyond the firewall. Adobe LiveCycle Forms improves the quality of captured information through instant data validation and calculations. When combined with Adobe LiveCycle Print, organizations can automate customized document printing and integrate print output into their existing communication workflows.

Adobe LiveCycle Reader Extensions

Adobe LiveCycle Reader Extensions allows people to do more with Adobe PDF files. Adobe LiveCycle Reader Extensions embeds usage rights into Adobe PDF files that in turn activate greater interactive functionality in Adobe Reader. People can save copies of filled-out forms, add comments and notes, sign documents with digital signatures, and submit forms either online or offline.

Adobe LiveCycle Form Manager

Adobe LiveCycle Form Manager provides a central repository for administrators who manage form publication and for people who access enterprise forms via web-based portals. By prepopulating forms with individual profiles, companies can reduce errors and increase accuracy. And because the form comes pre-filled with profile information, there's less work involved to complete each form.

Adobe LiveCycle Barcoded Forms

With Adobe LiveCycle Barcoded Forms, organizations can use proven two-dimensional barcode technology to automate the extraction of data from paper forms and deliver it to core systems for processing. This dramatically reduces costs, errors, and time compared to manual data entry and OCR-based solutions.

Adobe LiveCycle Designer

Adobe LiveCycle Designer makes it easy to create intelligent forms that combine high-fidelity presentation with XML data handling. Using the graphical interface, designers can quickly create secure templates that closely resemble their paper counterparts and accept digital signatures. Plus, they can easily define a form's business logic and bind form fields to generate interactive web and Adobe PDF forms that comply with government accessibility requirements.

Adobe Industry Solutions

Adobe LiveCycle software automates existing processes, makes information more accessible, and increases the security of online information exchange. Valuable for any organization, this software delivers substantial benefits for:

Government agencies –

meet challenging e-government mandates, such as HSPD-12; provide online citizen self-services; and interact with constituents, employees, and other government agencies more easily and securely.

Financial services providers –

turn transaction-based processes into highly efficient interactive processes that help improve customer satisfaction, help ensure regulatory compliance, and increase profitability.

Life sciences companies –

accelerate clinical trials, protect sensitive information, and automate the submissions process with increased accuracy and quality, which results in faster regulatory approvals and time to market.

Manufacturing firms –

interact with everyone along the product lifecycle—from design to production and customer to retailer—streamlining the manufacturing process and accelerating time to market.

DOCUMENT CONTROL AND SECURITY

Adobe LiveCycle Policy Server

Adobe LiveCycle Policy Server offers a convenient, effective solution for managing and monitoring electronic documents. With it, organizations can apply persistent confidentiality, privacy, and accountability policies to electronic documents—online or offline, inside or outside the firewall—throughout the document lifecycle.

Adobe LiveCycle Document Security

Adobe LiveCycle Document Security delivers digital signature and encryption capabilities in a server environment. Organizations can bring more paper-based processes online, reduce costs, and increase customer satisfaction—all while ensuring document authenticity, integrity, and confidentiality.

DOCUMENT GENERATION

Adobe LiveCycle PDF Generator

Adobe LiveCycle PDF Generator software enables organizations to centrally manage and control the creation of Adobe PDF documents across the enterprise. A server-based solution, Adobe LiveCycle PDF Generator offers three editions with a range of functionality designed to meet the document conversion needs of every organization.

Adobe Central Pro Output Server

Adobe Central Pro Output Server enables businesses to dynamically generate professional-looking documents—including purchase orders, invoices, and checks—from CRM, ERP, and legacy systems as well as other core applications. Saved as Adobe PDF files and delivered via the web, e-mail, fax, or print, these documents are easier for customers to read, understand, and respond to than those generated and sent directly from core systems.

Adobe Document Server

Adobe Document Server enables organizations to dynamically generate customized Adobe PDF documents for more personalized customer communications. These content-rich documents can be created, assembled, and manipulated on a server by importing XML-based data from enterprise applications into Adobe PDF templates.

COLLABORATION

Adobe Reader

Adobe Reader is free software that lets people view and print Adobe PDF files on a variety of devices and operating systems. To date, more than 500 million copies of the software have been distributed. Because so many people have Adobe Reader installed on their computers and know how to use it, organizations can distribute Adobe PDF files with confidence.

Adobe Acrobat® family

The Adobe Acrobat family of products provides the power to deliver documents that give business, creative, and technical professionals an intelligent way to get the job done. Create and exchange documents, collect and compare comments, and tailor the security of a file in order to distribute reliable and polished Adobe PDF documents.
