*eWEEK editors recommend new hardware, software and services that enterprise IT decision makers should have on their radars*

## Citrus 1.1

Gigamon's Citrus 1.1 helps manage cross-box connectivity by incorporating hundreds of ports into a networkwide data access network fabric. Citrus 1.1 features a new map rule and packet filtering window that creates customized data streams for security and monitoring tools. In a matter of minutes, according to the company, Citrus 1.1 can easily select and define map rules and filters, including IP address and port ranges, VLAN IDs, protocols, application ports, MAC addresses, and TCP ports. The total number of line rate filters has increased to as many as 4,000 per chassis. Gigamon has also introduced a new stacking window that shows all connected chassis, and indicates chassis type, box ID, hardware type and connectivity status. ## Adobe LiveCycle ES2

LiveCycle Mosaic ES2 is an RIA framework for rapidly assembling intuitive, personalized and activity-centric RIA applications. Users can switch between multiple tasks without losing work in progress, and can save workspaces to return to later, preserving data context on the server. Developers can extend existing enterprise applications by exposing their business logic and user interfaces into application "tiles." Tiles are context-aware, user interface application components that can be assembled to create unified views that best suit the user's work habits and specific needs. Users can also access workspaces while disconnected from the servers via an Adobe AIR desktop application, and can connect remotely from a browser client on both Windows and Macintosh operating systems.

## Red Condor Archive

Red Condor's Archive is a secure message archiving service that helps organizations meet compliance regulations, e-discovery support requirements, and data storage and management best practices. Archive leverages Red Condor's global cloud computer and storage infrastructure to deliver a scalable, software-free service that provides automatic backup of all inbound and outbound messages, supports all messaging systems and can be managed through an intuitive, Web-based interface. Archive is available as a subscription-based service.
