FOR IMMEDIATE RELEASE

Adobe and Microsoft Deepen Partnership to Work Smarter in the Cloud

Adobe Sign and Microsoft Speed up Productivity Wherever You Choose to Work

Hong Kong – 28 November 2019 — Adobe (Nasdaq: ADBE) has announced a deeper integration with Microsoft, which will empower brands to accelerate their digital transformation using Adobe Experience Cloud and Document Cloud. For years, Adobe and Microsoft have joined forces to unite data, content and workflows, to help brands worldwide transform their businesses. Their common vision to help companies derive more value from their data has helped drive such projects as the Open Data Initiative – a way to drive insights through data across silos.

Adobe and Microsoft have helped millions do their best work in the Microsoft tools they use every day. Today, they are deepening integrations between Adobe Sign and Microsoft Office 365, Dynamics 365, and Azure to simplify how work gets done, and help companies digitize their business.

Adobe Sign now integrates deeply with:

- **Microsoft SharePoint**: Customers can create and embed digital forms such as time-off requests that can be filled, signed, and reused indefinitely. This update is perfect for collecting information from a large number of people inside and outside the company, including brand new users. This information can be automatically saved to SharePoint folders and the data from form fields can be mapped back to a SharePoint list.

- **Microsoft Teams**: Collaborators can send documents for signature via a simple tab, and a bot allows team members to manage, track, and get notifications for the status of important documents like a contract or agreement. The Adobe Sign integration in Teams is also the first app out the gate to be certified as part of the Microsoft 365 Certification program, which ensures that enterprise data privacy and security are protected from the introduction of third-party developed applications in Microsoft 365.

- **Microsoft Azure:** Already live in the U.S., Adobe Sign is now available in Microsoft Azure in Europe, helping businesses meet EU data protection and privacy laws by storing all data, content, and information within the EU.

- **Microsoft Azure Active Directory (Azure AD)**: Also available, Microsoft Azure Active Directory (AD) enterprise customers can now enable single sign-on to securely deliver Adobe Sign to their employees in less than 30 minutes via the Adobe admin console, a central location

for managing Adobe solutions across the entire organization and secure seamless access for their employees.
